The addition of carbon contaminated the end product with carbides, and the addition of sulfur only rendered the procedure more complicated. The synthesis of monosulfide, was conducted according to the reaction Ce<sub>2</sub>S<sub>3</sub> + CeO<sub>2</sub> + 2C → 3CeS + 2CO. The reaction was carried out in a vacuum electric furnace at 1500-1600°C. The reaction products were contaminated with carbides and oxy sulfides of cerium; the pure product was obtained after subsequent second heating with an addition of 70% of the initial stoichiometric quantity of Ce<sub>2</sub>S<sub>3</sub>.
